

2. Navigating the Internet

Surfing the Internet is a fun and enjoyable activity. By clicking on various hyperlinks, you can visit many interesting websites and personal home pages. By *website* we mean an extensive system of web pages for a company or organization. A personal *home page* may consist of only a few web pages. It usually belongs to an individual, or contains only a little commercial information about a company.

The World Wide Web is infinitely large and increases by thousands of websites daily. After surfing for a while, you will no doubt want to revisit an interesting website from time to time. All those hyperlinks make it easy to lose your way, however.

Fortunately, *Internet Explorer* has several built-in options to help you get to where you want to go. In this chapter, you will learn how to use these convenient features, allowing you to 'navigate' straight to your target: back to the web pages you visited earlier.

In this chapter, you will learn how to:

- open a website from the list of addresses previously typed
- save a web address
- open a favorite
- organize your favorites
- use RSS feeds
- temporarily disconnect
- change the *Internet Explorer* home page
- use the *History*
- give a website its own shortcut

2.1 Starting Internet Explorer

Turn on the computer

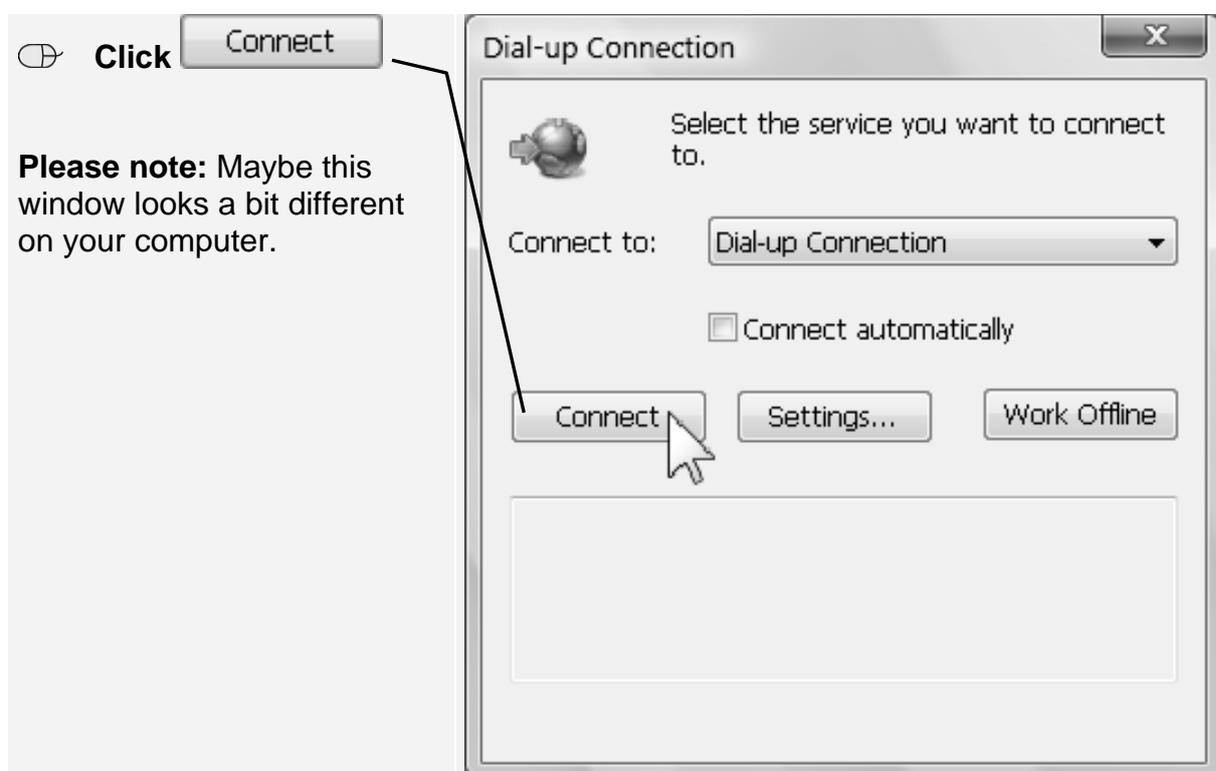

Do you have an external modem?

Turn on the modem

Now you can start *Internet Explorer*.

Start *Internet Explorer* 1

Internet Explorer starts, and you can connect to the Internet:

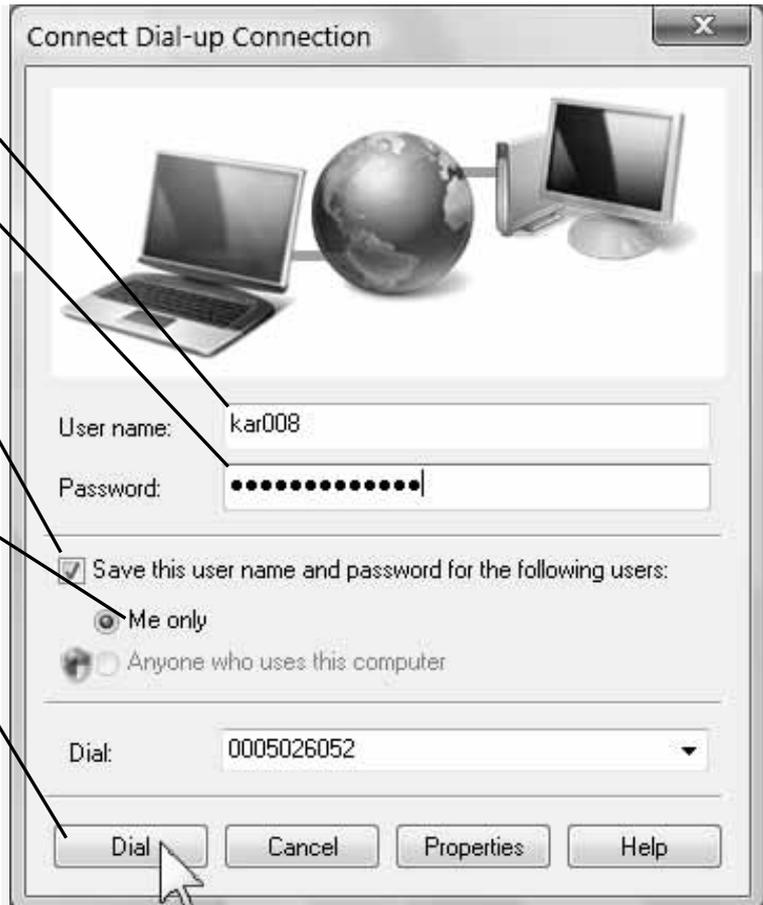

Please note:

If you are connected to the Internet by cable or DSL, then this *Dial-up Connection* window will not appear. Your computer is already connected to the Internet.

If your user name and password are not displayed:

-  **Type your user name**
-  **Type your password**
-  **Click a check mark for**
Save this user name and password
-  **Click** Me only
-  **Click** 

Please note: Maybe this window looks a bit different on your computer.

A connection is made to your ISP (Internet Service Provider).

You see the home page as it is set up on your computer:

This page might be different on your computer.

You will learn later how to change the page that appears when you start *Internet Explorer*.

2.2 The Address Bar

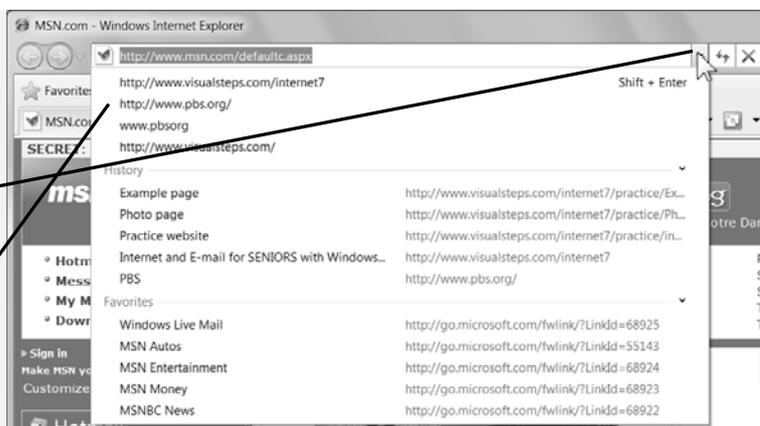

Internet Explorer has a useful feature on the Address bar. By clicking a button on the Address bar, you will see a list of website addresses that you have previously typed. You can use this list to reopen a website without having to retype the web address.

At the end of the Address bar:

Click

You see a list of web addresses you have visited before:

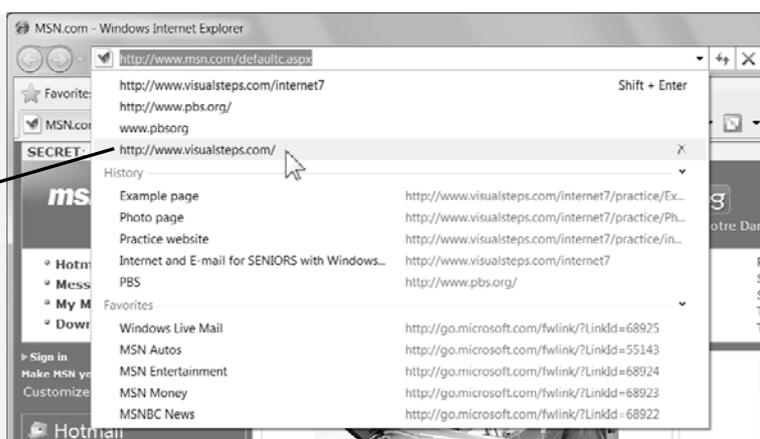

You can click one of these addresses to reopen the associated website:

Click

<http://www.visualsteps.com/>

The website for the Visual Steps publishing company will be opened. This method only works for a website that you recently visited. If you would like to keep a web address for a longer time, it is a better idea to save it.

2.3 Saving a Web Address

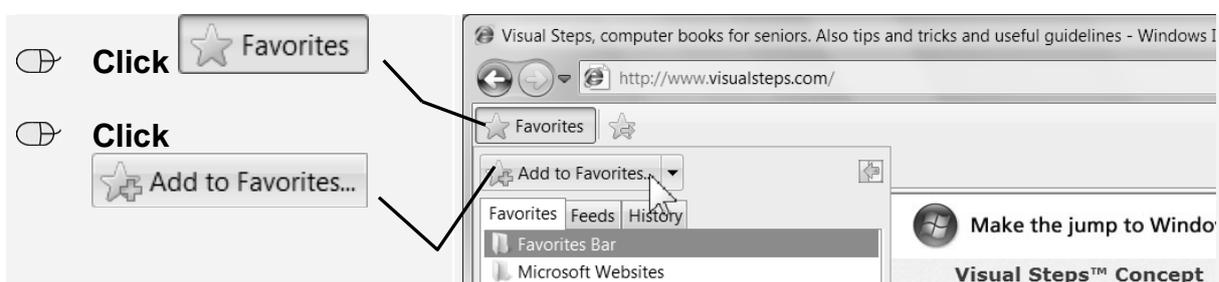

Once you have found an interesting website, you can save its address. From then on, you can quickly reopen this website anytime without having to remember the web address or retyping it. Saved websites are called favorites in *Internet Explorer*.

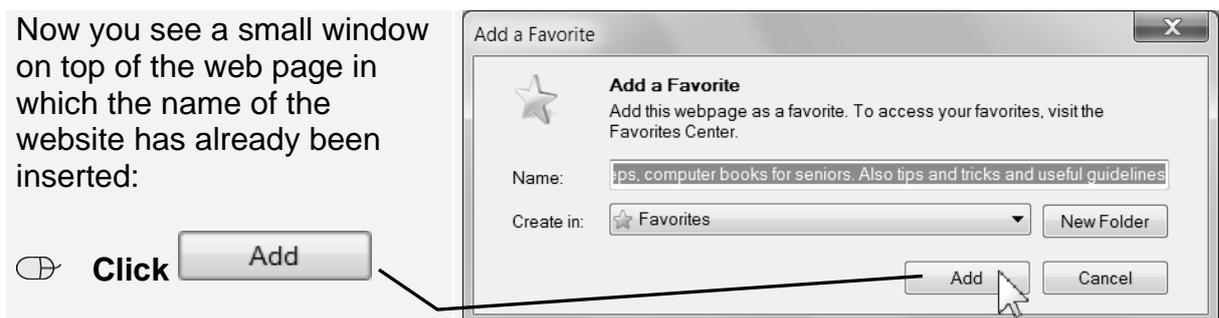

Please note:

You can only save a web address when the associated website is displayed in the *Internet Explorer* window.

In this case, you see the Visual Steps website:

Now you see a small window on top of the web page in which the name of the website has already been inserted:

Later, you will see how to quickly reopen this favorite website. To see how a favorite works, you will first need to go to a different website. You can go, for example, to the special website for seniors, *SeniorNet*.

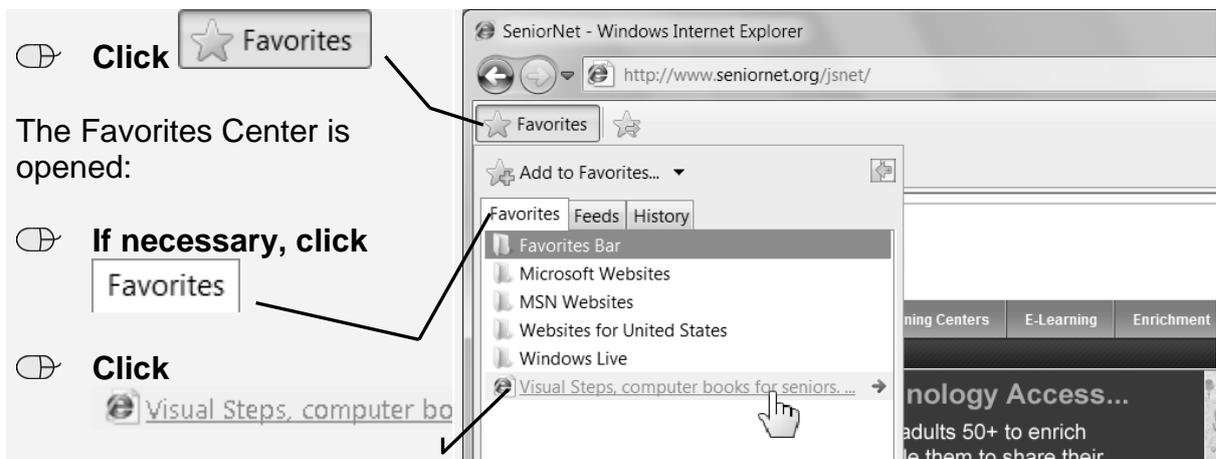

You see the *SeniorNet* home page:

Now you can open the favorite you just saved.

2.4 Opening a Favorite

You can quickly open your favorite websites using the Favorites Center:

Internet Explorer immediately jumps to the Visual Steps website:

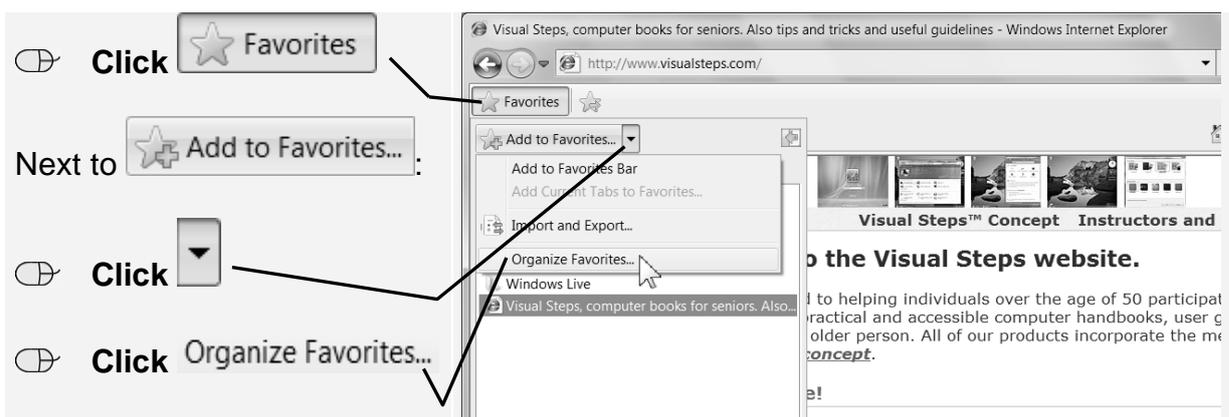

Internet Explorer remembers your favorites even after you have closed the program. This allows you to create an entire collection of websites that you can visit again later.

2.5 Organizing Your Favorites

You can save all your favorite websites in one long list in the Favorites Center, but in the long term this is not very practical. It is better to organize your favorites in separate folders. You can save websites according to subject, for example. You can also use folders to separate your own favorites from those of other users on the same computer.

For practice, you are going to create a folder for websites related to this book.

Now you see this window.
Usually there are already a

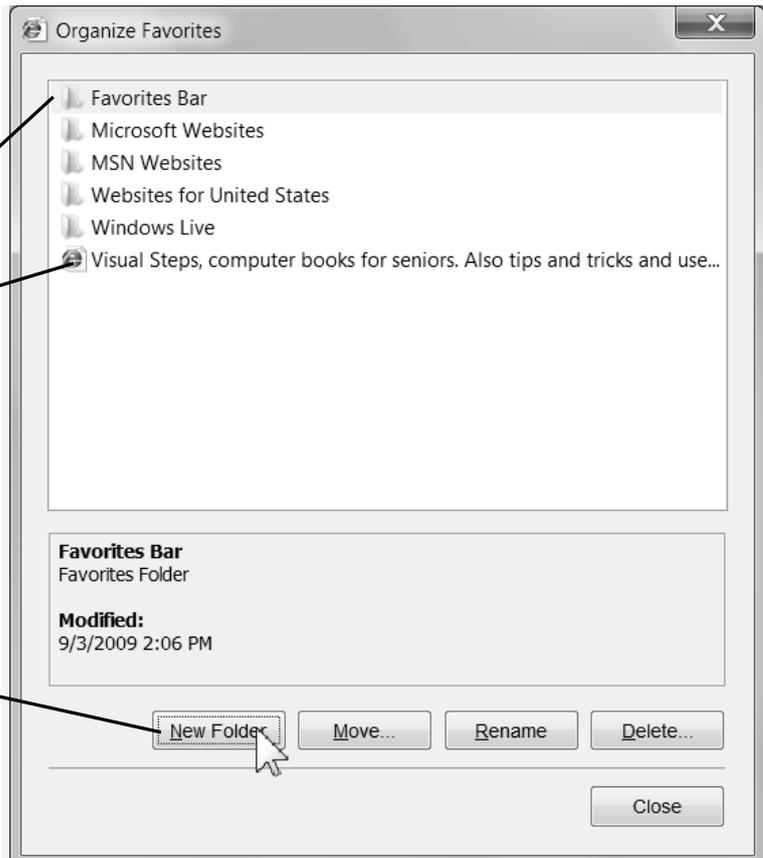

few  folders:

Below these folders is the
favorite you saved earlier:

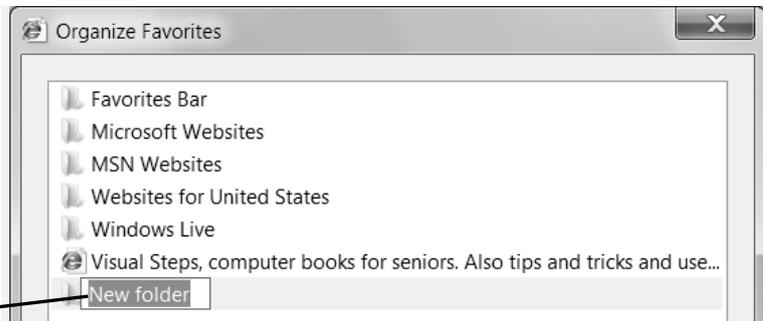

Click

New Folder

A new  folder appears at
the bottom of the list, and you
can immediately type a name
for it:

 **Type:** Internet Book

At the bottom of the window:

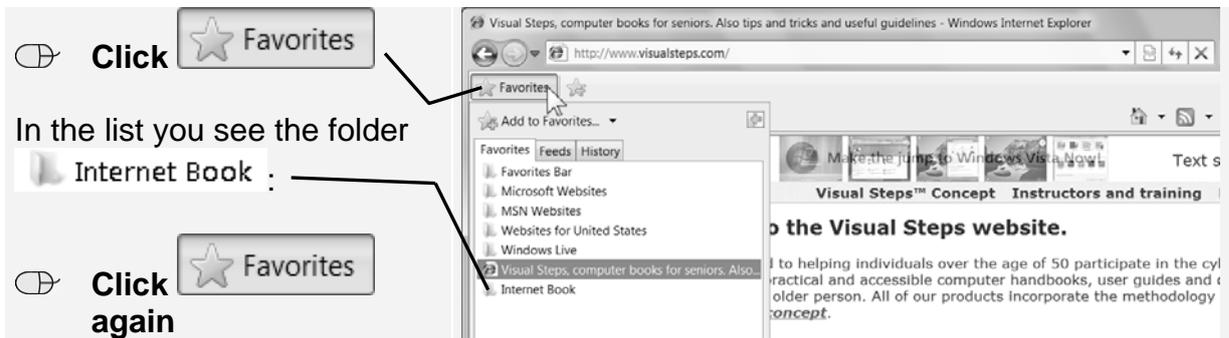

Click

Close

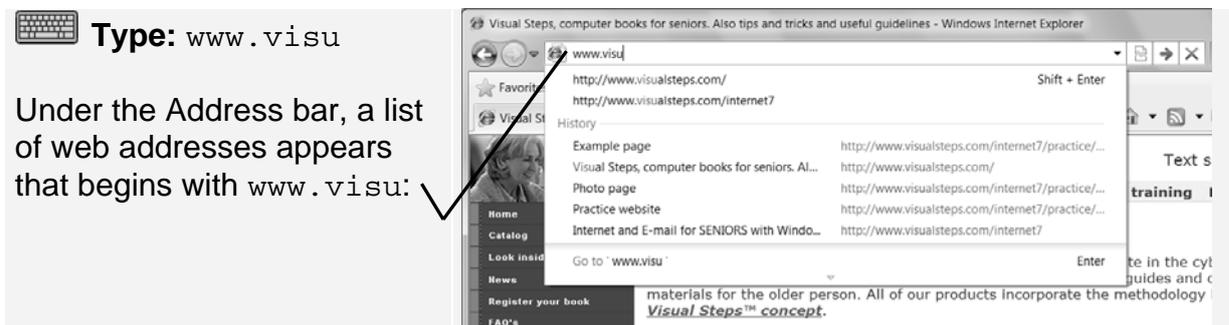

The folder has now been created. You can check this right away in the Favorites Center:

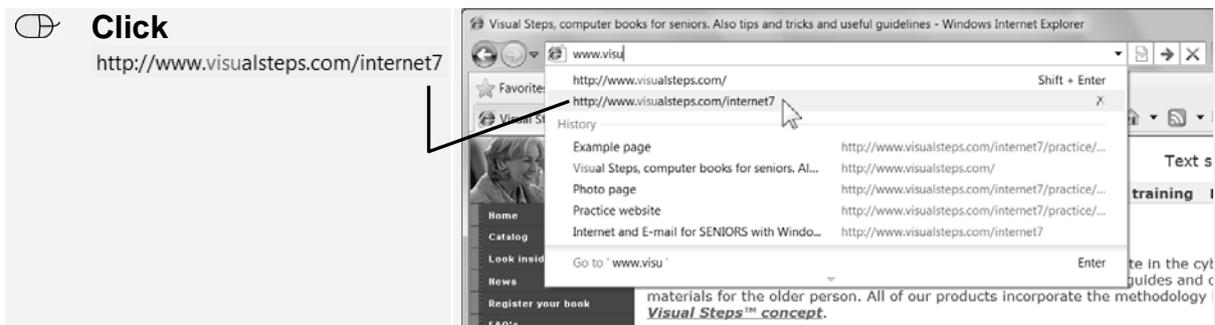

You have seen that the folder has been created. A little later on, you will read how you can save all the websites related to this book in this new folder.

2.6 Typing Part of a Web Address

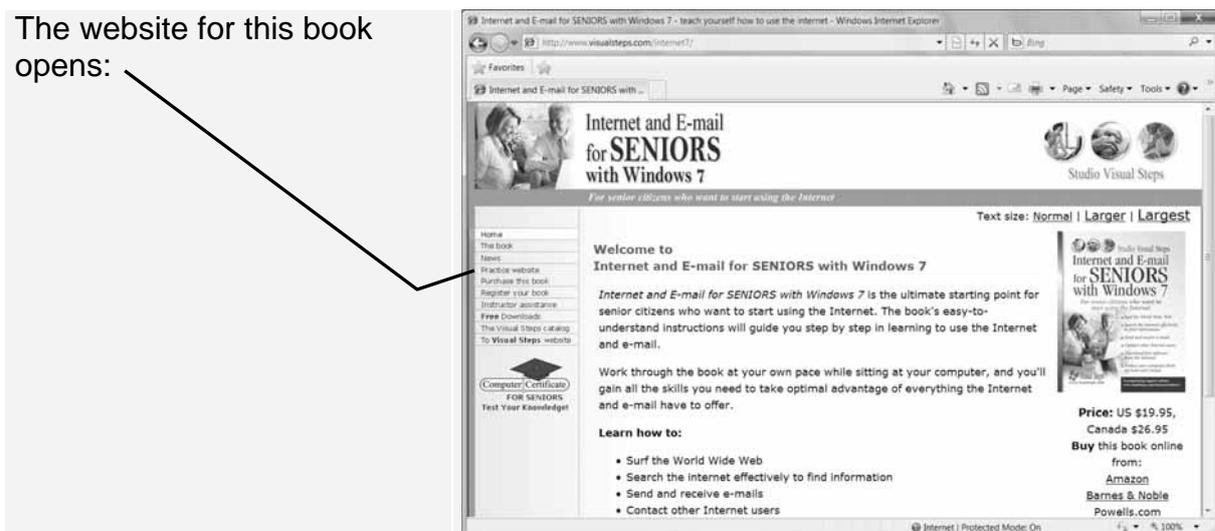

At the beginning of this chapter you read about the list of web addresses previously visited. This list can get very long, making it hard to find the address you need. Take a look now at what happens when you start typing just part of a web address:

Now you just need to click the desired web address in the list:

The website for this book opens:

Please note:

Pay attention to which address you click - *Internet Explorer* also remembers incorrectly typed web addresses.
